Received 1981 July 29

RESUMEN

Presentamos la fotometría de trece-colores de 16 estrellas Be, variables, que hemos observado en el Observatorio Astronómico Nacional en San Pedro Mártir, Baja California. Nuestros datos cubren los años de 1977 a 1979, y en nuestro trabajo hemos incluido mediciones de Johnson y Mitchell efectuadas desde 1965 hasta 1968 después de aplicar las correcciones necesarias para tener un grupo homogéneo de datos.

ABSTRACT

We present thirteen-color photometry of 16 variable Be stars observed at the Observatorio Astronómico Nacional in San Pedro Mártir in Baja California. Our data cover the years 1977 to 1979, and we include earlier measurements of Johnson and Mitchell from 1965 to 1968 that have been corrected in order to have a homogeneous set of data.

Key words: STARS Be – PHOTOMETRY – VARIABILITY

I. INTRODUCTION

Be and Shell stars have been studied both spectroscopically and photometrically for a number of years. However, there have been only a few systematic programs to determine their general observational characteristics. Hubert-Delplace and Hubert (1979) have published a spectroscopic atlas of 148 stars in the O8 to A2 range, covering the years 1953 to 1976. Feinstein and collaborators (1968, 1970, 1975, 1979) and Ferrer, Jascheck and co-workers (1971), have done a photometric survey of many southern Be and Shell stars, covering independently the UV and the IR parts of the spectrum. The photometric catalogues of Nicolet (1978) and Morel and Magnenat (1978) contain *UBVRI*... values reported in the literature for many Be stars. More recently, Jaschek *et al.* (1980) have done a classification of Be stars, including the best known data on spectroscopy, photometry, polarization, etc.

In 1977, we started a 13-color photometric survey of a list of 86 Be and Shell stars (Hubert-Delplace 1976). These stars are spectroscopically variable, and some show large changes both in their magnitudes and colors. We present in this paper photometry for the ones that show photometric changes larger than 0.15 mag.

II. OBSERVATIONAL TECHNIQUES

Our program was planned to observe ‘simultaneously’ from the near ultraviolet (3300 Å) to the near infrared (1.1 microns) with a photometric system well suited

to study early-type stars (Borgman 1960; Borgman and Blaauw 1964; Mitchell and Johnson 1969; Schuster 1981). The 13-color photometric system (Johnson and Mitchell 1975), makes use of two photometers, and 8C one (UV, blue, and visual colors) and a 6RC photometer (visual, red, and near infrared), and we are using simultaneously the 84 cm and 150 cm telescopes of the San Pedro Mártir observatory to obtain full 13-C photometry nightly for the Be stars. This allows us to detect and to correlate photometric changes that occur in the UV and in the near-IR.

We have been using the DC equipment (amplifiers No. 1 and No 4), observing techniques and reduction procedures as outlined by Schuster (1982). We have made a calibration during each observing run. From 1977 to 1979 the original filters and photomultipliers which defined the 13-C system were employed in all our observations, and so no problems have been encountered in transforming our data into the standard 13-C system. We have observed, when possible, the bluer 13-C standard stars, such as BS 1855 (B0 V) and BS 8622 (O9 V), to check our transformations.

III. RESULTS

Jaschek *et al.* (1980) have classified a sample of 140 representative Be and Shell stars in five physically significant groups on the basis of their spectral characteristics, photometry, polarization, rotational velocities, UV spectral types and spectroscopic variability. Through 1979, 69 (80%) of the 86 stars observed in our program

are common to their work. We have included in our observing list a few supergiants and some Bpe stars that have been excluded from the Jaschek *et al.* paper. From our list of 86 observed stars, thirty-one showed evidence of variability in at least one color or magnitude (Alvarez and Schuster 1981). Of these stars, sixteen have photometric changes larger than 0.15 mg.; the 13-C photometry of these sixteen stars is given in Table 1.

We see that the quality of our 13-C data is very good with 8C probable errors at unit air mass of ± 0.004 to ± 0.013 for bright O- and B-type stars and 6RC probable errors of ± 0.004 to ± 0.016 (except for 58–110 color which may have errors as large as ± 0.038). (Schuster 1981, Table 4. See also Mitchell and Johnson 1969, Table 3). Our criterion of 0.15 magnitude includes all Be stars which are surely variable.

The data of Table 1 is arranged as follows: The first three lines contain some general characteristics of the stars, such as its identification, starting with the BS (Hoffleit 1964), HD, and MWC (Merrill and Burwell 1933, 1943, 1949) numbers and its name. Then we have the group classification according to Jaschek *et al.* (1980). From this work we include the $V \sin i$, the V magnitude and the MK, Q and UV spectral types of the star. (UND) comes from the work of Underhill *et al.* (1979). (SP.TY.) comes from Hubert-Delplace and Hubert (1979). From this work we include a short description of its spectral properties. For BS 1209 (Table 1), the spectral type has been determined by M. Jaschek (O9.5 V) from the Morgan-Keenan classification criteria and by R. Herman (O9-B0) following the Rojas and Herman (1955) criteria. The first column gives the Julian Day of the observation (minus 2 400 000); column 2 gives the 52 mag (5183 Å effective wavelength); columns 3 to 9, show the colors corresponding to the 8C system; column 10 gives the 58 magnitude (5827 Å effective wavelength), which is common to both systems and is used for tying together the observations; columns 11 to 15 show the colors of the 6RC system; and the last column gives the individual air masses.

We report the individual observations ordered by date and as mentioned earlier, frequently our data cover the whole 13-C range within one night or within only a few nights. We include also some earlier 13-C measurements reported by Johnson, Mitchell and Latham (1967), and

Mitchell and Johnson (1969), after applying the corrections indicated by them (Mitchell and Johnson 1969). Their data correspond to Julian Days less than 2 443 000 days. In this way, the whole set of 13-C photometry becomes homogeneous and can be inter-compared directly.

We would like to thank G. Sánchez, C. Valle, J.M. Murillo, R. Murillo and E. López of the Observatorio Astronómico Nacional for their assistance during the whole observing program. We acknowledge computing facilities offered by the Centro de Investigación Científica y Educación Superior de Ensenada (CICESE) in carrying out the data reduction and analysis.

This is contribution No. 35 of Instituto de Astronomía, UNAM.

- BS 1180 = HD 23862 = MWC 75 = 28 Tau Pleione.
 GRP III, $V \sin i = 330 \text{ km s}^{-1}$, $V = 5.09$ variable. MK = B8 V, Q = B8.
 Change in emission. Strong shell of H and metals developed in 1972.
- BS 1209 = HD 24534 = MWC 78 = x Per.
 $V \sin i = 150 \text{ km s}^{-1}$. $V = 6.10$ variable. Sp. Ty. = O9.5 V (1) O0-B0 (2).
 Large change in emission. Weak helium shell.
- BS 1789 = HD 35439 = MWC 110 = 25 Ori.
 GRP V, $V \sin i = 316 \text{ km s}^{-1}$. $V = 4.95$, MK = B1 V, Q = B1, Sp. UV = DB1, UND = B1.5 IVe.
 B – Be from 1953 to 1974. In 1975 $\text{H}\alpha$ again in absorption.
- HD 45314 = MWC 140.
 $V = 6.64$, Sp. Ty. O9-B0?
 Important changes in emission. Temporary hydrogen shell.
- BS 4787 = HD 109387 = MWC 222 = 5 K Dra.
 GRP I, $V \sin i = 243 \text{ km s}^{-1}$. $V = 3.87$, MK B5 IV, Q = B5, Sp. UV = GB6, UND = B5 IVe.
 Strong emission lines. Temporary shell component that changes within several days.
- BS 5941 = HD 142983 = MWC 239, 48 Lib.
 GRP III, $V \sin i = 393 \text{ km s}^{-1}$. $V = 4.88$ variable. MK = B4 III, Q = B, Sp. UV = GB2.5, UND = B3 Ve.
 Hydrogen and metallic variable shell showing great changes.
- BS 6118 = HD 148184 = MWC 241 = 7 Psi Oph.
 GRP I, $V \sin i = 134 \text{ km s}^{-1}$. $V = 4.42$ variable. MK = B1 V, Q = O9.
 Very strong emission lines decreasing in intensity from 1969 to 1975.
- HD 162428 = MWC 594.
 GRP II, $V \sin i = 350 \text{ km s}^{-1}$. $V = 7.0$, MK = B7 Vn.
 Changes in emission lines and a variable Hydrogen shell.
- BS 6664 = HD 162732 = MWC 88 Her.
 GRP V, $V \sin i = 300 \text{ km s}^{-1}$. $V = 6.68$, MK = B7 Vn, Q = B7.
 Be + Shell → B Hydrogen and metallic shell.
- HD 173371 = MWC 956.
 GRP IV, $V \sin i = 350 \text{ km s}^{-1}$, $V = 6.8$, MK = B8 III, Q = B7.
 Changes in the $\text{H}\alpha$ line, Be → B in 1974.
- BS 7106 = HD 174638 = MWC 306. β Lyra, eclipsing binary + gaseous streams.
 $V = 3.4$ variable. B8 + F?.
- Primary mass = $11 M_{\odot}$, secondary mass > $20.2 M_{\odot}$.
- HD 184279 = MWC 319.
 GRP V, $V \sin i = 228 \text{ km s}^{-1}$, $V = 6.94$, MK = B0.5, Q = B0.5.
 B → Be + temporary shell of hydrogen, helium and Fe III.
- BS 7763 = HD 193237 = MWC 338, 34 P Cyg.
 $V = 4.90$, Sp. Ty. = B1 e, Bpe.
 Shell always in expansion.
- BS 8047 = HD 200120 = MWC 359, 59 Cyg. F1 Cyg.
 GRP I, $V \sin i = 374 \text{ km s}^{-1}$, $V = 4.74$ variable, MK = B1, Q = B0, Sp. UV = GB1, UND = B1 IVe.
 Variable emission lines + temporary shell of hydrogen, helium and ionized metals. BE → B in 1976?
- BS 8731 = HD 217050 = MWC 394, BW Lac.
 GRP I, $V \sin i = 350 \text{ km s}^{-1}$, $V = 5.43$, MK = B3 III, Q = B3, Sp. UV = GB 2.5.
 Strong and rapidly variable emission lines + strong shell of hydrogen and metals.
 Night to night variations.
- HD 218393 = MWC 397.
 Spect. Bin. P = 38 D, $V = 7.02$, Sp. Ty. = B0 IV-III.
 Variable lines hydrogen shell, metallic shell lines vary with P = 38 D.
