### RESUMEN

El presente trabajo contiene los resultados de la re-examinación del material fotográfico obtenido con la cámara Schmidt en Tonantzintla, en la región de Orión, centrado en el trapecio durante los años 1955-1981. El trabajo contiene los resultados de 116 ráfagas: 38 corresponden a nuevas ráfagas, 78 son repeticiones de las ráfagas conocidas, descubiertas principalmente en Tonantzintla. Cuatro de ellas fueron observadas en los observatorios de Abastumani y Rogen.

### ABSTRACT

This paper contains the results of a re-examination of all the photographic material obtained with the Schmidt telescope in Tonantzintla on the Orion association between the years 1955 and 1981. During this re-examination 116 flare-ups were detected, of these, 38 correspond to new flare stars and 78 are flare-up repetitions of known flare stars, mainly discovered at Tonantzintla. Four of these were recently observed at Abastumani and Rogen observatories.

*Key words:* STARS-FLARE

### I. INTRODUCTION

The re-examination of the photographic material on the Pleiades at Tonantzintla Observatory by Haro and González (1970), yielded a good number of new flare stars and repetitions of flare-ups of known flare stars. In order to estimate the physical parameters and in particular the evolution of stellar aggregates, it is necessary to have more complete information on flare stars at definite intervals of time.

Photographic material of the Orion association from Tonantzintla Schmidt plates, covering essentially the interval from 1959 to 1978, allowed us to find 38 flare stars and 78 flare-ups of known flare stars. The total observational time is about 930 hours.

1. The authors dedicate with admiration their paper to Guillermo Haro, as a tribute to his pioneering and continued work on flare stars.

### II. NEW FLARE STARS AND REPEATED FLARES

The results obtained from the present re-examination are summarized in Tables 1 and 2. In Table 1 the new flare stars are presented. In column 1 we continue the Tonantzintla numbering of the Orion association flare stars, designated 261 to 298; the second column gives the number from the catalog of Parenago; the third and fourth columns give the approximate equatorial coordinates (error in R.A.  $\pm 0.6$  s, in Dec.  $\pm 0.30''$ ) (1900); column five, the apparent ultraviolet magnitude at minimum; column six the  $\Delta U$  (the amplitude of the flare event in the U magnitude); column seven the spectral type; column eight the date of the flare-up; column nine indicates the chart where the stars are marked; column ten lists the references.

Figure 1 (Plate 1) gives the approximate location of the new flare stars. Identification of each of these 38 flare stars is given in Figures 2 and 3 (Plates 2 and 3).

a. References: 1. Walker 1983, 2. Parsamian and Chavira 1982.

b. Star flare on weak star.

Table 2 lists the flare stars that have been detected and published previously at Tonantzintla, Abastumani and Rogen observatories or found during the present study.

Data on 16 flare-ups of star T176, which is not a member of the Orion association, are given

elsewhere (Parsamian and Chavira 1990).

This work was carried out in collaboration with Graciela González and Guillermo Haro.

We are thankful to A. Serrano for his support and P. Pişmiş for critical reading of the manuscript.
