

MICROMETER MEASUREMENTS OF SOUTHERN DOUBLE STARS MADE AT THE NATIONAL OBSERVATORY OF LLANO DEL HATO, VENEZUELA

J. F. Ling¹ and C. Prieto²

Observatorio Astronómico “Ramón María Aller”

Received 1998 April 22; accepted 1998 August 31

RESUMEN

En este artículo se presentan 151 medidas micrométricas de 66 estrellas dobles observadas con el refractor de 65-cm del Observatorio Nacional de Llano del Hato en Mérida, Venezuela, durante los meses de febrero de 1997 y febrero de 1998.

ABSTRACT

This paper reports 151 micrometer measurements of 66 double stars observed with the 65-cm refractor at the Venezuelan National Observatory at Llano del Hato, Mérida, during February 1997 and February 1998.

Key words: **ASTROMETRY – VISUAL BINARIES**

1. INTRODUCTION

We report micrometer measurements of visual double stars made during February 1997 and February 1998 at the Llano del Hato Observatory of the Centro de Investigación en Astronomía (CIDA) at Mérida, Venezuela, using a refractor of 65-cm aperture and focal length 10.6 m. The procedure was the same as previously described by Prieto (1997). Most observations have an estimated error of $\pm 2^\circ$ for position angles and 15% for angular separation. In 1997 the visual conditions were very unfavorable and only 20 measurements were obtained, but in 1998 seeing was in general quite good, between $0''.4$ and $2''.5$.

2. RESULTS

Table 1 lists 151 measurements of 66 binaries and the residuals for 24 of them in the following format:

column 1 shows the star’s WDS catalogue number (Worley & Douglass 1997), and subsequent columns its ADS catalogue number (Aitken 1932) if any, name (with identifying letters in the case of multiple star systems), the epoch of the observation, the observed position angle (θ) and angular separation (ρ), the number of nights on which the star was observed, the identification code of the observer (LIN for Ling and PRI for Prieto), the observed – calculated discrepancies in θ and ρ , the author code using the discoverer code of WDS and year of publication of the orbit.

For the star SEE 219 (WDS15088-4517) the ephemeris for the observation epoch appears in parentheses.

Most of the orbits were taken from Worley & Heintz (1983) or Couteau, Morel, & Fulconis (1986); but for all orbits used, an appropriate reference is given.
