DYNAMICS OF BLACK HOLES PAIRS IN A HIERARCHICAL UNIVERSE: THE SMBHS DESCENDANTS OF Z = 1 BINARY MERGING GALAXIES

E. M. Martínez-Palafox¹ and O. Valenzuela¹

1. INTRODUCTION

The current understanding of the cosmic large-scale structure origin is included in the ΛCDM scenario. According to this cosmological model the self-gravitating systems at galactic scales have been formed following a hierarchical process of mass accretion and mergers. Thus, it is possible to find a relationship between dark matter halos mass accretion/merging histories and the interactions between galaxies. Considering that all stellar spheroids have a black hole in their center, raises as a natural question whether the BHs follow the galaxies assembly history. The BH pairs in their path to coalesce may produce a wide range of signals according to the BH pair properties (separation between BH, masses, etc.), from gravitational waves at small separations (≪1 pc) to multiple accreting BH spatially resolved (∼kpc), or a variable electromagnetic flux due to the orbital motion. If the coalescence process is not efficient or common there might be intermediate mass BH wandering within the galaxies. This signatures would open up entirely new scientific opportunities, to probe fundamental physics, astrophysics and cosmology. We present preliminary results of this PhD thesis project and comment on the expected results.

2. PRELIMINARY RESULTS

2.1. The tool

We have studied the response of a gaseous disk to an external potential (Goldreich & Tremaine 1979) considering a system of a BH pair with triple disks: 2 accretion disks around each BH and a circumbinary disk (Hayasaki 2009) including cosmic mass accretion through a semianalytical tool.

The circumbinary disk removes angular momentum through resonant interaction while cosmic mass transfer adds some fraction of its angular momentum to the orbital angular momentum of the BH pair.

Key Words: accretion, accretion disks — binaries: general — black hole physics — galaxies: nuclei

the local Universe to calculate its effect on the BH pair orbital angular momentum.

We have used mass accretion histories from a numerical simulation of $64 \, h^{-1}$ Mpc with 256$^3$ particles with mass $m_p = 1.63 \times 10^7 \, M_\odot$, that reproduces the main features that characterise the local Universe (Gottl"ober et al. 2010).

2.3. The constrained sample

We have selected dark matter halos corresponding to merging galaxies pairs as initial conditions for our model based on the galaxies selection criteria used by Bell et al. (2006). The sample consists of $\sim 150$ pairs of halos with separations $\lesssim 30$ kpc and masses $M_h \gtrsim 2.5 \times 10^{10} \, M_\odot$ at $z = 1$. We have followed the evolution of the pairs in the sample mentioned above, in particular the distance evolution between BHs in pairs at different epoch (see Figure 2).

3. SUMMARY & CONCLUSIONS

BH pairs and their signatures are valuable as probes to general relativity, probes of accretion disk properties, cosmological observations and gravitational waves sources counterparts.

Constrained simulations represent a powerful tool to understand the history of the best known part of the Universe. By using them it is possible to construct a constrained sample of possible merging galaxies corresponding to any epoch of the local Universe.

Depending on the efficiency of the angular momentum transport mechanisms we are able to get the separations distribution of pairs in the local Universe. The current preliminary results suggest that disk-BH pair interaction is a mechanism by which BH pairs can coalesce within a Hubble time and BH merger rate is small in the local Universe (see Figure 2).

Currently there is an important effort in the astronomical community to perform a census of the black hole pairs population at different stages. Once they are completed our study will be important to make data interpretation.

EMMP thank the Organizing Committee for its partial financial support to attend this meeting. We thank Pedro Colín and the CLUES collaboration for providing us with the mass accretion histories and catalogs of the simulation.
